E-Powerload – The system solution for electromobilit

Castellan technology & design

CHARGING AND BILLING IN THE CAR PARK

Use the parking time to charge up and pay conveniently.

Due to their existing infrastructure, car parks are well suited to the further expansion of electromobility. Both system solutions offered by car park operators (Convenient billing together with the Parking ticket) as and stand alone solutions from external providers (including energy providers or e-mobility service providers, billing e.g. via GSM network), can be integrated without a great deal of installation effort. Combined with the sophisticated Castellan-Software (system control, car park surveillance, billing) the operators always have a transparent overview of all the components connected to the system - regardless of the type and quantity of charging stations.

For installation in car parks and underground garages, we have developed the compact wall charging system, which is exclusively made with high quality components in Germany, and is impact, water and dust resistant. The E-Powerloads can be completely individualised in terms of colour, logo placement and design.

Even during development, we placed a great deal of importance on future oriented and extendible systems with high operating comfort. In practice, this is primarily expressed in intuitive operation and the most familiar sequences possible:

The car park customers take their parking ticket at the entrance as usual, register at the station, and use the parking time to charge up. Depending on whether it is a charging station provided by a car park operator, or a charging system operated by an external provider, payment for the electricity costs will be made together with the parking ticket or separately (e.g. Via RFID, GSM or mobile phone).

1

On entry
Take parking ticket

2

Look for parking
space and
e-charging station
Activate via
the ticket

3

Connect vehicle
to e-charging station
(insert plug),
Select charging box
and current type

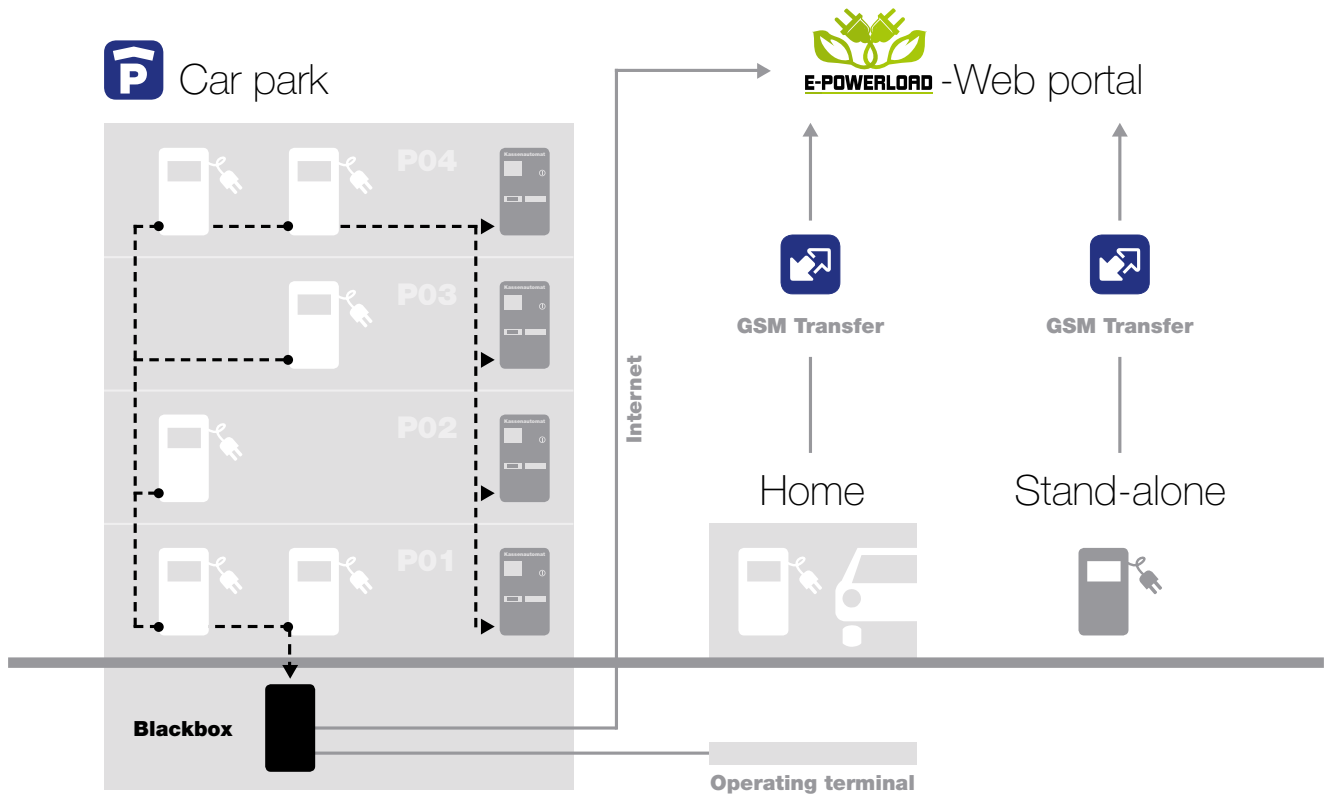

4

Charging
process

FUNCTIONING OF THE CHARGING SYSTEM

The next generation “E-Powerload“

5

At the end of the parking time (Ticket in car park machine) the charging process will end

6

Data transfer at the ticket machines via network connection (either Ethernet, WLAN, dLAN or EDGE/UMTS/LTE according to customer wishes)

7

On request: Print out of parking and electricity receipt

8

To exit insert the paid parking ticket into the machine as usual

BILLING SYSTEMS AND AREAS OF USE

SMS billing

Start the charging process with the help of your smartphone – you will be billed conveniently via your mobile provider. Or use our own SMS billing activation system. (Stand Alone).

Barcode

Barcode is one of the most common systems. Only lengthwise and crosswise are differentiated.

QR-Code

The QR-Code is suitable for scan processes and links directly to a web link, where corresponding information is stored.

Magnetic strips

These systems are often used in connection with car park ticket machines.

1 RFID 1

Start the charging process conveniently with your RFID card included in the scope of delivery. Billing occurs via the Castellan E-Load online portal.

2 RFID 2

Start the charging process for your e-vehicle with your trusted RFID Badge of your trusted RFID card. We use your existing technology and integrate it into our system. We take care of the bill - use our Castellan E-Load online portal. A customer RFID reader and a badge and/or card is required per charging station.

Car park 1: barrier free!

With our car parking solutions, your customers always have a charged vehicle. With the parking ticket obtained on entry, you can start the charging process conveniently at the charging station. This will be ended and billed directly via your existing parking ticket machines, before you leave the car park again with your fully charged vehicle.

Car park 2: Short term parker/ long term tenant

With our car parking solutions, your customers always have a charged vehicle. Short term parkers can conveniently start the charging process at the charging station, with the parking ticket obtained on entry to the car park. This will be ended and billed directly via your existing ticket machines. Thanks to RFID cards, long term tenants have the option to charge their vehicle, and have the incurred costs billed via the RFID module.

Ladenetz

ladenetz.de is a network of public utilities, whose charging stations you can use to fill up your car with electricity quickly and easily, using the “charging card” of your public utility. You can recognise the charging stations by the uniform ladenetz.de logo. You can also use the stations of ladenetz roaming partners. You can find all charging stations and further information at:

www.ladenetz.de

1 INTERFACE

1 CONTRACT

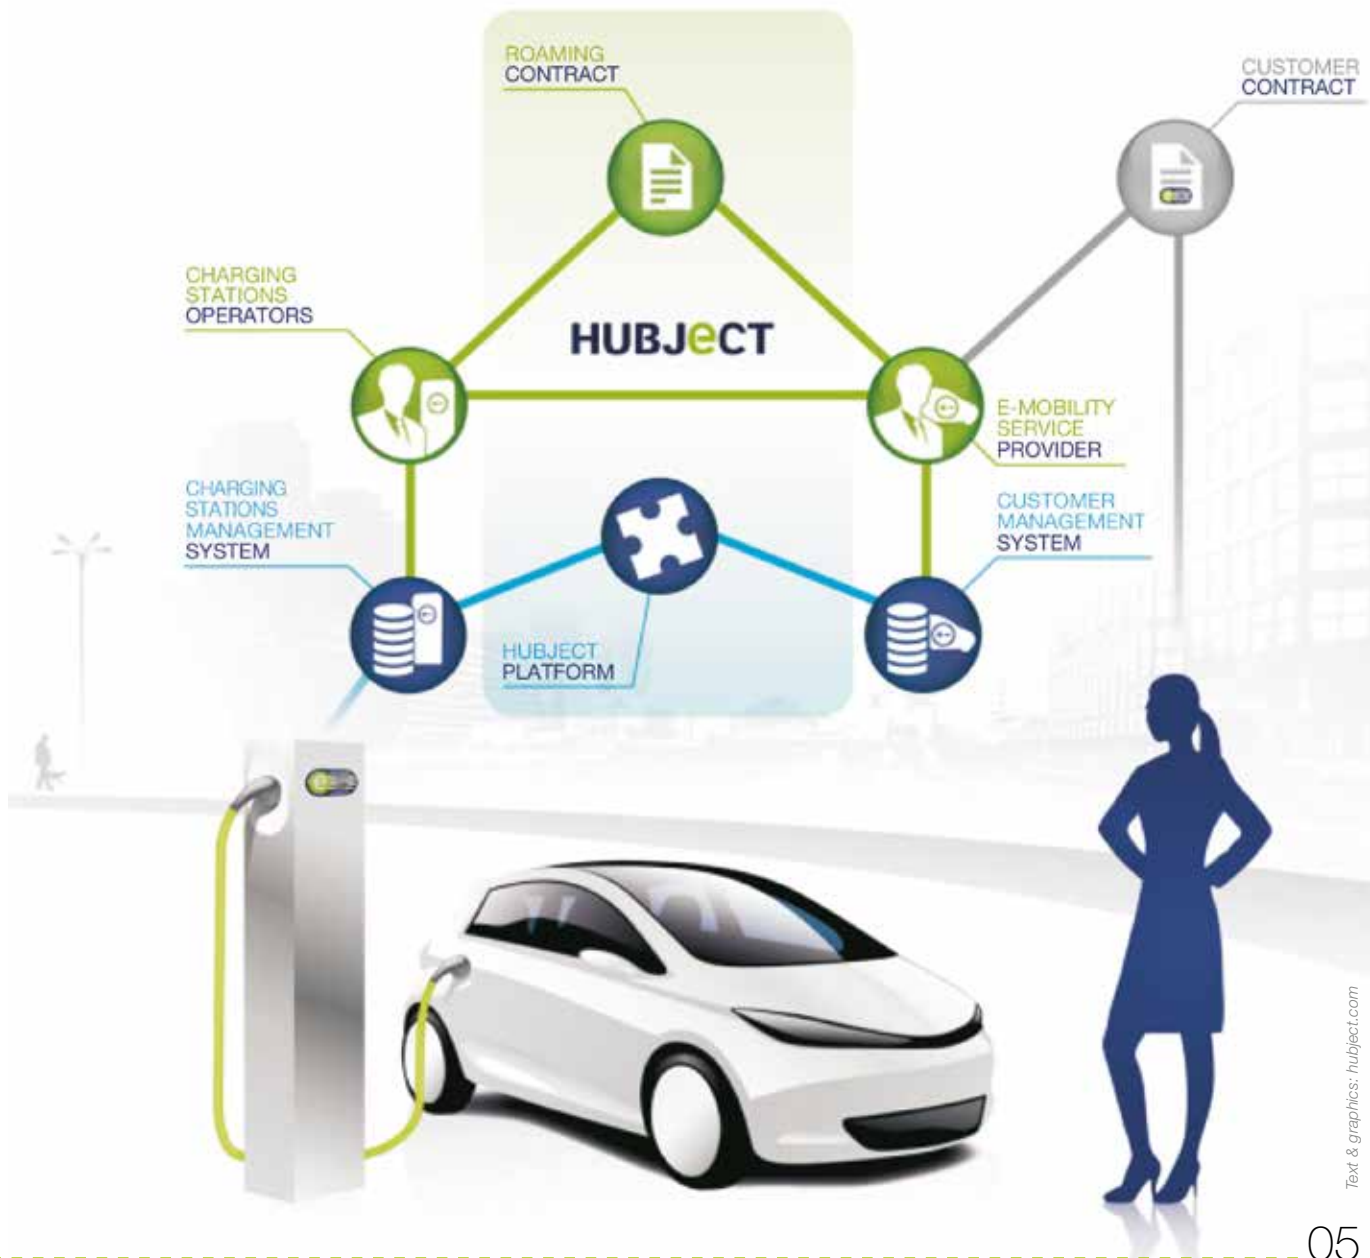

N PARTNER

Hubject

The business and IT platform of Hubject allows collaboration between various market participants in electromobility. The customers of the affiliated partners, receive access to all public charging stations that are connected to the platform, via just one contract, via eRoaming. Basically, there are two significant business roles, that a market participant can take on: the provision of charging poles and energy (charging station operator) or offering services such as traction current contracts (Elec-

tromobility provider). It is also possible, for an affiliated partner to fulfil both roles. Furthermore, the proposal of the eRoaming platform is oriented towards fleet operators, OEMs and manufacturers of charging infrastructure systems. Therefore, apart from the charging stations of their own electromobility providers, the charging stations of other providers are also available to drivers of electric cars. So they receive the best possible service in an open market model for electromobility.

POSSIBLE BILLING SYSTEMS AT A GLANCE.

However you want it: **Convenient and individualised billing.**

Cash
With a charging system for car parks, connected to the ticket machines, you pay the bill for the usage time of electricity charging, conveniently and as usual, together with your parking ticket.

Mobile phone
You can carry out identification and payment conveniently via your mobile phone. The usage billing is added to the monthly bill of your mobile phone provider (only possible at charging stations with GSM module).

Money card (EC/credit)
Don't have any cash or don't have the right change to hand? No problem, most parking ticket machines accept money cards or EC cards for the payment of parking and electricity usage fees.

RFID card
An electronic legitimization card authorises the user to activate the charging system. Via the RFID module the users can be assigned and billed for individual charging processes. The RFID card is suitable for long term parkers and monthly billing customers.

Bar code
The charging process starts automatically by scanning the parking ticket at the charging pole. When scanning and paying for the ticket at the car park ticket machines, the charging will automatically end.

Pin code
The user receives access to the charging station, by entering a PIN that only they know, via a number pad or touch screen.

P Car park ticket machine
Whether you are just parking, or charging your vehicle while parking: You pay the fee incurred (electricity usage and/or parking costs) as usual at the car park ticket machines.

Magnetic strips
Parking duration and electricity usage will be stored on the magnetic strips of the parking tickets. Charging process starts by scanning the magnetic strip at the charging pole, and ends with payment at the machines.

GSM data transfer
For home or stand alone charging systems: All data of the charging station (For example location, date, user, electricity usage) will be transferred to a server portal for user identification and billing.
